

Applications of Linear Systems: dvt Problems

Feb 15/2011

Some strategies:

1. Identify what the question wants. This may tell you one or both of your variables.
2. Remember $d = v t$ 
3. Use a table to fill in known and unknown values to help form your equations.
4. Make sure your units are all consistent.

Feb 19-9:38 PM

Ex.1. Alex drove 500 km from Ottawa to Toronto in $5 \frac{1}{2}$ h. He drove part of the way at 100 km/h, and the rest of the way at 80 km/h. How far did he drive at each speed?

	distance (d)	speed (v)	time (t)
Trip 1	x	100	$\frac{x}{100}$
Trip 2	y	80	$\frac{y}{80}$
Total	500	 	5.5

$$x + y = 500 \quad ① \quad \frac{x}{100} + \frac{y}{80} = 5.5 \quad ②$$

$$② \times 400 : \frac{400x}{100} + \frac{400y}{80} = 400(5.5)$$

$$4x + 5y = 2200 \quad ③$$

$$① \times 4 : 4x + 4y = 2000$$

$$\text{Subtract} \quad y = 200$$

Sub $y = 200$ into ①

$$x + 200 = 500$$

$$x = 300$$

\therefore he drove 300 km at 100 km/h
and 200 km at 80 km/h

Feb 19-9:38 PM

Ex.2 Emily travelled 95 km from Oakville to Oshawa by car and GO train. The car averaged 60 km/h, and the train averaged 90 km/h. The whole trip took 1.5 hours. How long was she in the car?

$d = vt$

	distance (d)	speed (v)	time (t)
GO Train	$90x$	$= 90$	x
car	$60y$	$= 60$	y
Total	95		1.5

$$90x + 60y = 95 \quad (1) \quad x + y = 1.5 \quad (2)$$

$$x = -y + 1.5 \quad (3)$$

Sub (3) into (1)

$$90(-y + 1.5) + 60y = 95$$

$$-90y + 135 + 60y = 95$$

$$-30y = -40$$

$$y = \frac{-40}{-30}$$

$$y = \frac{4}{3}$$

$$y = 1\frac{1}{3}$$

(3)

\therefore time in car was 1h 20min.

$$\begin{array}{r} \frac{1}{2} - \frac{1}{6} \\ \frac{3}{6} - \frac{1}{6} \\ \hline \frac{2}{6} \\ \hline \frac{1}{3} \end{array}$$

$$\frac{3}{3} + \frac{1}{3} = 1\frac{1}{3}$$

Feb 19-9:38 PM

Ex.3. A boat took 2 h to travel 24 km down a river with the current and 3 h to make the return trip against the current. Find the speed of the boat in still water and the speed of the current.

	distance (d)	speed (v)	time (t)
down river	24	$x + y$	2
up river	24	$x - y$	3
Total	48		5

Let x be speed of boat in still water
Let y be speed of the current

$$d = vt$$

$$24 = (x + y)(2)$$

$$24 = 2x + 2y \quad (1)$$

$$24 = (x - y)(3)$$

$$24 = 3x - 3y \quad (2)$$

$$\textcircled{1} \div 2: 12 = x + y \quad (3)$$

$$\textcircled{2} \div 3: 8 = x - y \quad (4)$$

$$\text{add } 20 = 2x$$

$$x = 10$$

Sub $x = 10$ into (3)

$$12 = 10 + y$$

$$y = 2$$

\therefore speed of boat is 10 km/h
Speed of current is 2 km/h

Assigned Work:

p.27 # 8

p.55 # 13

p.64 # 7

+ Worksheet

Feb 17 - 10:58 AM

p.55 #13

	d	v	t
paved	x	10	$\frac{x}{10}$
rough	y	5	$\frac{y}{5}$
total	12		1.5

$x + y = 12$ ①
 $\frac{10x}{10} + \frac{10y}{5} = 1.5$ (x10)
 $x + 2y = 15$ ②

$x + y = 12$
 $x + 2y = 15$
 Subtract $-y = -3$
 $y = 3$

Sub $y = 3$ into ①
 $x + 3 = 12$
 $x = 9$

\therefore the distance over rough ground is 3km

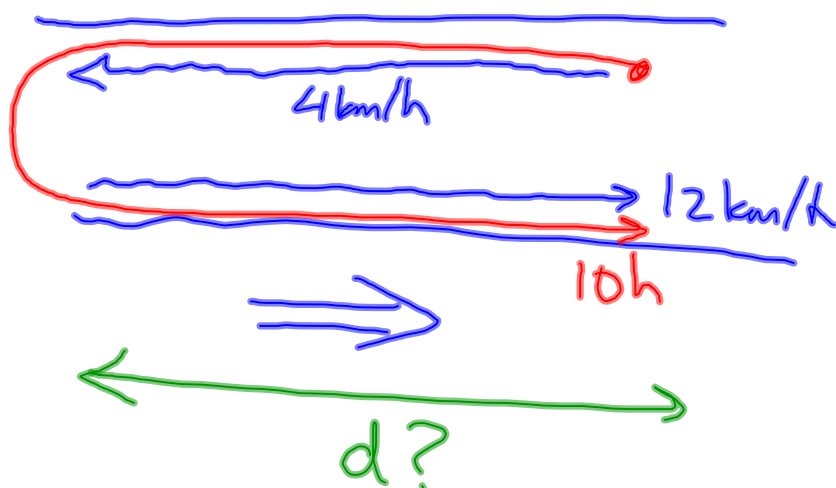

Feb 16-12:29 PM

p.27
#8

	d	v	t
highway	x	70	$\frac{x}{70}$
* narrow road	y	50	$\frac{y}{50}$
total	393	X	6

$x + y = 393$ ① $\frac{x}{70} + \frac{y}{50} = 6$ $\times 350$
 $\frac{50x}{70} + \frac{350y}{50} = 6(350)$
 $5x + 7y = 2100$ ②
 ① $\times 5$: $5x + 5y = 1965$
 Subtract
 $2y = 135$
 $y = 67.5$
 \therefore the distance from NB to T is 67.5 km
