## MHF4U - Unit 1: Characteristics and Properties of Functions

## Lesson 7: Operations with Functions

The graph below shows the level of $\mathrm{CO}_{2}$ (parts per million) in the air at the Mauna Loa Observatory in Hawaii over about 12 years, ending in 1995.

| Date | $\mathbf{C O}_{2}$ |
| :---: | :---: |
| Jan 1995 | 359.82 |
| Feb 1995 | 360.86 |
| Mar 1995 | 361.49 |
| Apr 1995 | 363.30 |
| May 1995 | 363.63 |
| Jun 1995 | 363.10 |
| Jul 1995 | 361.73 |
| Aug 1995 | 359.28 |
| Sep 1995 | 357.87 |
| Oct 1995 | 357.56 |
| Nov 1995 | 359.36 |
| Dec 1995 | 360.49 |

The scatter plot shows that from year to year, the concentration of $\mathrm{CO}_{2}$ in the air has increased. However, within each individual year the concentration of $\mathrm{CO}_{2}$ oscillates.

If a function $f(t)$ is used to model the average $\mathrm{CO}_{2}$ level from year to year, the graph of $f$ would run through the middle of the scatter plot between the individual peaks and valleys.

If we used $g(t)$ to model the sinusoidal function representing each year we can then add the two functions together to model the data:

Over this relatively short period of time, a linear function models the rise in the annual average $\mathrm{CO}_{2}$ levels. However, over a longer period of time we see that an exponential function models this better.

This is one example where we need to combine functions. In this case, for each $x$-value, the combined function's $y$-value is equal to the sum of the individual function's $y$-values, i.e. $h(x)=f(x)+g(x)$.

Ex. If $f(2)=3$ and $g(2)=8$ then $h(2)=11$.
Note that the domain of the combined function is the intersection of the domains of the individual functions.

Functions can also be subtracted and multiplied.
Ex. Let $f=\{(1,2),(3,4),(5,6),(7,8)\}$ and $g=\{(1,5),(3,7),(4,0),(7,7)\}$, determine
a) $f+g$
b) $f-g$
c) fg

Ex. Given $f(x)=x+6$ and $g(x)=(x-1)^{2}$
a) What type of function will $k(x)=f(x) g(x)$ be?
b) Determine an equation for $k(x)$.
c) Complete the table of values.

| $x$ | $f(x)$ | $g(x)$ | $k(x)$ |
| :---: | :--- | :--- | :--- |
| -6 |  |  |  |
| -5 |  |  |  |
| -4 |  |  |  |
| -3 |  |  |  |
| -2 |  |  |  |
| -1 |  |  |  |
| 0 |  |  |  |
| 1 |  |  |  |
| 2 |  |  |  |
| 3 |  |  |  |
| 4 |  |  |  |

d) Graph $k(x)$ on the grid provided.

e) Where are the $x$-intercepts for each function?
f) Where are the $y$-values of each function positive/negative?

HW: Pg. 56 \#1cd, 2b, 3b, 4b, 7
