

Factoring using Common Factors*March 30/2010*

## 1. Using a Model (e.g., alge-tiles)

Model the expression as an area. The lengths of the sides are factors.

Some factors can be reduced further. Repeat this process until no factors can be reduced.

Mar 26-8:24 AM

Factor:  $3x^2 + 2x$ 

$$3x^2 + 2x = x(3x + 2)$$

Mar 25-8:02 AM

Factor:  $2x^2 + 4x = x(2x+4)$

$2 \begin{array}{|c|c|} \hline x & 1 \\ \hline x & 1 \\ \hline \end{array} = x(2)(x+2)$   
 $x+2 = 2x(x+2)$

Mar 25-8:02 AM

Factor:  $2x^2 + 4x = 2x(x+2)$

\* can sometimes  
construct different  
rectangles for area  
→ some are better than  
others at finding factors

Mar 25-8:02 AM

## 2. Factor Algebraically

Look for the greatest common factor of the coefficients and the GCF of the variables.

Ex. Factor:  $8x^3 - 6x^2y^2 + 4x^2y$

The GCF of 8, 6, and 4 is 2.

The GCF of  $x^3$ ,  $x^2y^2$ , and  $x^2y$  is  $x^2$ .

$$\begin{aligned} 8 &\leftarrow (2) \cdot 4 \cdot 8 \\ 6 &\leftarrow (2) \cdot 3 \\ 4 &\leftarrow (2) \cdot 4 \end{aligned}$$

$$\begin{aligned} x^3 &= x \cdot x \cdot x \\ x^2y^2 &= x \cdot x \cdot y \cdot y \\ x^2y &= x \cdot x \cdot y \end{aligned}$$

$$\begin{aligned} 8x^3 - 6x^2y^2 + 4x^2y &= \underline{2x^2(4x) - 2x^2(3y^2) + 2x^2(2y)} \\ &= \underline{2x^2(4x - 3y^2 + 2y)} \end{aligned}$$

Mar 26-8:24 AM

## 3. Factoring by Grouping

Some polynomials do not have common factors in all terms. They can sometimes be factored by grouping terms with common factors.

Ex. Factor:  $\overbrace{ac + bc}^c + \overbrace{ad + bd}^d$

$$= c(a+b) + d(a+b)$$

$$= (a+b)(c+d)$$

*(a+b) is common*

or

$$\overbrace{ac + bc}^a + \overbrace{ad + bd}^b$$

$$= a(c+d) + b(c+d)$$

$$= (c+d)(a+b)$$

Mar 26-8:24 AM

Assigned Work:

Handout Section 3.4

1. Complete in class & submit/show:  
# (1-4)(abc)
2. Homework  
# (1-4)(rest)

$$\begin{aligned}
 &9a^3 + 27b^2 \\
 &= 3(3a^3 + 9b^2) \\
 &= 3(3)(a^3 + 3b^2) \\
 &= 9(a^3 + 3b^2)
 \end{aligned}$$

Mar 26-9:06 AM

$$\begin{aligned}
 &5x + 25 \\
 &= 5\left(\frac{5x}{5} + \frac{25}{5}\right) \\
 &= 5(x + 5)
 \end{aligned}$$

$5 \leftarrow 1, \textcircled{5}$   
 $25 \leftarrow 1, \textcircled{5}, 25$

$$\begin{aligned}
 &2(c) \quad 12y - 8y^2 + 24y^3 \\
 &= 4y\left(\frac{12y}{4y} - \frac{8y^2}{4y} + \frac{24y^3}{4y}\right) \\
 &= 4y(3 - 2y + 6y^2)
 \end{aligned}$$

$$\frac{y \cdot y}{y}$$

$$\frac{y \cdot y \cdot y}{y}$$

Mar 30-11:42 AM

$(2a+3)(a-4)$

FoIL

$= 2a^2 - 8a + 3a - 12$

$= 2a^2 - 5a - 12$
