

Applications of Quadratics in Factored Form Nov 9/2011  
 Note: All examples from lesson are included in handout.  
 You only need to write out solutions.

1. A rectangular lot is bounded on one side by a river and on the other three sides by 80m of fencing. Determine the dimensions of the largest lot possible.

maximum area

$$A = l \cdot w \quad \textcircled{1}$$

$$w + l + w = 80 \quad \textcircled{2}$$

$$l + 2w = 80 \quad \textcircled{3}$$

for substitution, need to isolate a variable

$$\textcircled{3}: l = 80 - 2w \quad \textcircled{4}$$

Sub  $\textcircled{4}$  into  $\textcircled{1}$

$$A = l \cdot w$$

$$A = (80 - 2w) \cdot w \quad \leftarrow \text{quadratic expression in factored form}$$

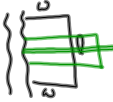

Want max Area  $\rightarrow$  vertex  
 use zeroes to find vertex.

Set  $A = 0$

$$0 = (80 - 2w) \cdot w$$

$$80 - 2w = 0 \text{ or } w = 0$$

$$80 = 2w$$

$$40 = w$$

to find  $w$  for max area

$$w = \frac{40 + 0}{2} \quad (\text{axis of symmetry})$$

$$w = 20$$

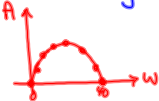

Sub  $w = 20$  into  $\textcircled{4}: l = 80 - 2w$

$$l = 80 - 2(20)$$

$$l = 80 - 40$$

$$l = 40$$

$\therefore$  dimensions for max area are 20m by 40m

Apr 19-7:41 PM

2. Supermarket cashiers try to memorize current sale prices while they work. A study showed that, on average, the percent,  $P$ , of prices memorized after  $t$  hours is given approximately by the formula

$$P = -40t^2 + 120t$$

What is the greatest percent of prices memorized, and how long does it take to memorize them?

$$P = -40t^2 + 120t$$

$$P = -40t(t - 3)$$

for zeroes, set  $P = 0$

$$0 = -40t(t - 3)$$

$$-40t = 0 \text{ or } t - 3 = 0$$

$$t = 0 \quad t = 3$$

for vertex,  $t_v = \frac{0 + 3}{2}$

$$t_v = 1.5$$

$\therefore$  study for 1.5 hours to maximize amount memorized

Sub  $t = 1.5$  in  $P = -40t^2 + 120t$

$$= -40(1.5)^2 + 120(1.5)$$

$$= -40(2.25) + 180$$

$$= -90 + 180$$

$$= 90$$

$\therefore$  the max memorized is 90% in 1.5 hours

Apr 20-5:48 PM

3. The cost of a ticket to a hockey arena is \$3, and the arena holds 800 people. At this price, every ticket is sold. A survey indicates that for every dollar increase in price, attendance will fall by 100 people.
- (a) What ticket price results in the greatest revenue?  
(b) What is the greatest revenue?

$$\text{Revenue} = (\text{price})(\# \text{ sold})$$

$$2400 = (3)(800)$$

$$2800 = (4)(700)$$

$$3000 = (5)(600)$$

$$R = (3 + x)(800 - 100x)$$

Apr 20-5:50 PM

4. Determine the number which exceeds the square of the same number by the greatest possible amount.

Apr 20-5:51 PM

Many word problems dealing with quadratic relations in factored form are concerned with financial situations (i.e., money). You may find the following definitions useful:

**Revenue:** The income for the business; the amount of money that comes into the business; positive.

**Cost:** The expenses for the business; the amount of money that goes out of the business; negative.

**Profit:** The difference between *revenue* and *cost*.

$$\text{Profit} = \text{Revenue} - \text{Cost}.$$

A positive profit is good for a business, and a negative profit (also called a *loss*) is bad.

**Break-Even Point :** The point where profit is zero. This is where profit changes between positive and negative.

p. 157 # 13, 14, 15

Unit Test - Tuesday, November 8th

Suggested Review:

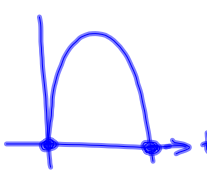

- read through all notes
- revisit homework questions
  - redo questions that caused problems

p.184 # 1, 3, 5, 6, 8, 9, 10, 11ace, 12  
14ace, 15ac, 16

p.240 # 2, 6, 7, 9, 10, 11, 13ace, 16ace, 17ace  
19ace

12.  $h = 20t - 5t^2$   
 $h = 5t(4-t)$

set  $h = 0$   
 $0 = 5t(4-t)$

$5t = 0$  or  $4-t = 0$   
 $t = 0$        $4 = t$

↑ hits ground

$t_{\text{vertex}} = \frac{0+4}{2}$   
 $= 2$

for  $h_{\text{vertex}}$ , sub  $t_v = 2$   
 $h_v = 5(2)(4-2)$   
 $= 10(2)$   
 $= 20 \quad \therefore V(2, 20)$

Nov 7-10:33 AM

P. 141  
 $y = 500 - 5x^2$   
 height      time

raft dropped at  $x = 0$   
 $y = 500 - 5(0)^2$   
 $= 500$   
 $\therefore$  helicopter is 500m high

(b) want zeros ( $y = 0$ )  
 $0 = 500 - 5x^2$   
 $0 = 5(100 - x^2)$   
 $0 = 5(10-x)(10+x)$   
 $10-x = 0$  or  $10+x = 0$   
 $10 = x$        $x = -10$

$\therefore$  raft hits water after 10 seconds.  
 inadmissible inad but  $x > 0$   $t > 0$

(c) set  $x = 6$   
 $y = 5(100 - 6^2)$   
 $= 5(100 - 36)$   
 $= 5(64)$   
 $= 320$

(d)  $y = 100$ , what is  $x$ ?  
 $100 = 500 - 5x^2$   
 $-400 = -5x^2$   
 $\frac{-400}{-5} = \frac{-5x^2}{-5}$   
 $80 = x^2$   
 $x = \pm\sqrt{80}, x > 0$   
 $x = \sqrt{80}$   
 $x \approx 8.94$   
 $\therefore$  after 8.94s, height is 100m

Nov 7-10:44 AM

p. 158  
# 14

\$10	80
11	75
12	70

$$R = (10 + x)(80 - 5x)$$

Set  $R = 0$

$$0 = (10 + x)(80 - 5x)$$

$$10 + x = 0 \quad \text{or} \quad 80 - 5x = 0$$

Nov 7-10:58 AM

p. 147 #13

$$P = 120x - 60x^2$$

$$P = -60x^2 + 120x$$

$$P = -60x(x - 2)$$

for zeroes, set  $P = 0$

$$0 = -60x(x - 2)$$

$$\begin{aligned} -60x &= 0 \\ \frac{-60}{-60} & \frac{0}{-60} \\ \boxed{x=0} \end{aligned}$$

$$\begin{aligned} x - 2 &= 0 \\ \boxed{x=2} \end{aligned}$$

$$\begin{aligned} \text{axis of sym: } x &= \frac{0+2}{2} \\ &= 1 \end{aligned}$$

$$\begin{aligned} \text{max value, sub } x=1 \\ P &= -60x(x-2) \\ P &= -60(1)(1-2) \\ P &= -60(-1) \\ P &= 60 \end{aligned}$$

$\therefore$  max profit is \$60,000

Nov 8-9:21 AM
